SUMMARY

Transonic wind tunnel tests have been conducted on a 1/8th scale model of a Mk82 bomb. The tests covered an incidence range of -2° to 28° and a Mach number range of 0.95 to 1.20 for roll angles between -45° and $+45^{\circ}$. The tests indicated that model exhibited static longitudinal stability for all conditions except at low Mach numbers and incidences greater than about 20° .

C_D	Drag force coefficient = Drag force / $\frac{1}{2} \rho V^2 S$
C_N	Normal force coefficient = Normal force / $\frac{1}{2} \rho V^2 S$
C_X	Axial force coefficient = Axial force / $\frac{1}{2} \rho V^2 S$
C_{XB}	Base force coefficient = $(p_h - p) S_B / \frac{1}{2} \rho V^2 S$
C_Y	Side force coefficient = Side force / $\frac{1}{2} \rho V^2 S$
C_l	Rolling moment coefficient = Rolling moment / $\frac{1}{2} \rho V^2 S d$
C_m	Pitching moment coefficient = Pitching moment / $\frac{1}{2} \rho V^2 S d$
C_n	Yawing moment coefficient = Yawing moment / $\frac{1}{2} \rho V^2 S d$
d	Body diameter = 34.14 mm (1.344in)
M	Free stream Mach number
P	Free stream static pressure
P_B	Model base pressure
R	Reynolds' number based on body diameter
S	Body cross sectional area = 915.5 mm ² (1.419in ²)
S_B	Model base area = 107.1 mm ² (0.166 in ²)
V	Free stream velocity
ρ	Free stream density
θ	Angle of incidence
ϕ	Model roll angle ($\phi=0$ - suspension point screws uppermost)

- Note: 1. See Fig. 1 for sign conventions for forces and moments.
2. Nominal centre of gravity located 125.42mm (4.938in) from the nose.

INTRODUCTION

At the request of the Weapons Research and Development Wing of the Weapons Research Establishment a series of transonic wind tunnel tests were carried out on a 1/8th scale model of a Mk82 bomb. These tests were conducted in support of the research project "Store Separation from Aircraft" being pursued by the Weapons Research Establishment. To avoid the construction of a new model for these tests, an existing model and balance were supplied by W.R.E. This model had been tested at subsonic and higher supersonic speeds at W.R.E. and the tests reported here were required to investigate the longitudinal and lateral stability of the bomb in the transonic and low supersonic speed range.

The tests reported herein were conducted in the Aeronautical Research Laboratories' transonic wind tunnel during December 1976.

2. TEST DETAILS

2.1 Model

A dimensioned sketch of the 1/8th scale model of the Mk82 bomb is presented in Figure 2. Transition was fixed on the body by a row of discrete roughness spheres. The six component sting mounted strain gauge balance supplied with the model by W.R.E. was used for all tests.

2.2 Wind Tunnel

All tests were conducted in the A.R.L. transonic wind tunnel. The nominal dimensions of the tunnel test section are 813mm by 533mm. For these tests the test section walls were all longitudinally slotted (Fig.3) with an open area ratio at the model location of 10.5%.

The maximum frontal cross-sectional area of the model at zero incidence was 915mm^2 giving a blockage ratio of 0.21%. No corrections for the effects of tunnel interference were applied to the results.

Mach number and dynamic pressure were derived from measurements of the static pressure in the plenum chamber surrounding the test section and of the static pressure in the contraction entry, assuming these to be the static and total pressures respectively of the test section flow.

2.3 Test Programme

Six component force and moment coefficients were measured over an incidence range of $-20^\circ < \theta < 280^\circ$ in 20° increments, for roll angles in the range $-45^\circ < \phi < 45^\circ$ in $7\frac{1}{2}^\circ$ increments. Model attitude was corrected for sting and balance deflections under load. The range of Mach number covered for each attitude was $0.95 < M < 1.20$ in increments of 0.05. In addition, several runs were conducted at zero roll angle and various incidences with fine increments in Mach number to investigate the detailed form of variations with Mach number in the region where shock reflections were apparent.

The variation of test Reynolds number (based on body diameter) with Mach number is presented in Figure 4.

3. RESULTS AND DISCUSSION

Complete results from the present tests are presented in Table I (See Fig. 1 for sign conventions).

Figures 5 and 6 show the variation of normal force coefficient and pitching moment coefficient with angle of incidence for selected representative roll angles ($\phi = -45^\circ, -22.5^\circ, 0^\circ, +22.5^\circ, +45^\circ$). The results show static longitudinal stability under all conditions except at lower Mach numbers and angles of incidence greater than about 20° where some instability is evident.

It was expected that the model would be subject to shock wave reflection interference over a range of supersonic Mach numbers. Since Schlieren observations of the flow in this test section were not possible, an estimate was made of the Mach number range for which this would be the case. The estimate was based on the assumption that wave reflection interference would commence at the Mach number for which a wave from the body shoulder was reflected back to the fin leading edge, and would continue with increasing Mach number until the nose shock reflection fell downstream of the model base. Reflection at the free stream Mach number was assumed, and the position of the nose shock was estimated by Moeckel's ¹ geometric method. As shown in Fig. 7 the estimated Mach number range for the model at zero incidence was from 1.01 to 1.07.

Figure 8 shows the variation of pitching moment coefficient with Mach number for the fine Mach number increment, extended Mach number range runs. It is evident that wave reflection interference is present for Mach numbers in the range 1.00 M 1.08 ; in good agreement with the estimate.

The variation of rolling moment coefficient with angle of incidence is shown in Fig. 9 for $M=0.95$ & 1.20 and selected roll angles. The results for these Mach numbers were chosen since they should be free of interference effects and are representative of all the other tests. Fig. 9 shows a positive rolling moment at zero angle of attack of approximately 0.02 which remains constant under all conditions and can be attributed to the $1\frac{1}{2}^\circ$ cant of the fins. The behaviour of the rolling moment curves are typical of all fin stabilised stores when the fins are not symmetrically disposed about the plane of angle of incidence. When the angle of incidence exceeds about 10° , the fins on the leeward side of the body are influenced appreciably by non uniformity of the flow separating from the body. As the angle of incidence increases beyond 10° this influence becomes very marked and, at some roll angles, results in the annulment of the rolling moment due to fin cant. The effect of fin cant is also seen in the asymmetry of the effects of roll angle.

Similar plots of the variation of yawing moment and side force coefficients are shown in Figs. 10 and 11. Similar remarks to those made for the previous figure are also relevant to the variation with angle of incidence in both these cases.

4. CONCLUSIONS

Transonic wind tunnel tests of a 1/8th scale model of a MK82 bomb have indicated that the model exhibits static longitudinal stability throughout the range of attitudes ($-20^\circ \leq \theta \leq 28^\circ$; $-45^\circ \leq \phi \leq 45^\circ$) and Mach numbers ($0.95 \leq M \leq 1.20$) covered in these tests. The model exhibits a variation of rolling moment at high angles of incidence which is typical of stores on which the fins are not symmetrically disposed about the incidence plane. The influence of roll angle on rolling moment is sufficient at some roll angles to overcome the rolling moment due to fin cant.
